

# TSUNADO Public Alerting EARTHQUAKE

Our planet is unpredictable. Earthquakes occur all the time, but every so often, the result is catastrophic. There is currently no known way to reliably provide adequate warning of an impending earthquake. Post-event however, communication and information flow is critical to manage the human tragedy. With power and normal communications non-existent, the **TSUNADO** Alert Radios are able to operate using broadcast radio and satellite transmissions, the most reliable methods of communication known to date.

**TSUNADO** Alert Radios are activated by standard radio signals delivered by existing FM radio stations, or satellite channels, delivering the Alert message easily and cost effectively.

**TSUNADO** Public Alerting has features such as dedicated audiences, and geo-targeted messaging. Low level alerts can be delivered just to the front screen, while high level alerts will wake you from your deepest sleep.

**TSUNADO** Alert Radios are discrete and elegant, and are a welcome addition to every home. They can be unplugged quickly, and become portable radios, with a battery life of up to 10 days.
