TSUNADO Public Alerting in Rural Bush Fires

Bush and forest fires can be unpredictable. Sometimes the information needed for people to survive needs to be delivered quickly, at all times of the day or night, and to regions that can be very remote. By using both FM Radio and Satellite transmissions, the **TSUNADO** Alert Radios provide a cost effective solution for alerting and information distribution - before, during, and after a fire.

TSUNADO Alert Radios are activated by standard radio signals delivered by existing FM radio stations, or satellite channels, delivering the signal easily and cost effectively.

TSUNADO Public Alerting has features such as dedicated audiences, and geo-targeted messaging. Low level alerts can be delivered just to the front screen, while high level alerts will wake you from your deepest sleep.

TSUNADO Alert Radios are discrete and elegant, and are a welcome addition to every home. They can be unplugged quickly, and become portable radios, with a battery life of up to 10 days.
