TSUNADO Public Alerting in the Mining Industry

Mining and people don't always go together. In situations where the public live in close proximity to mining activity, then it is important to maintain good communications when blasting, reducing the startle effect by the discrete notification provided by **TSUNADO**.

TSUNADO Alert Radios provide fast and effective notification to the public living in close proximity. Activated by standard radio signals, an existing FM radio station, or a dedicated transmitter can be employed to deliver the signal easily and cost effectively.

TSUNADO Public Alerting was originally developed for Emergency Response applications, and has features such as dedicated audiences, and geo-targeted messaging. It has now been taken up in mining applications to provide a user friendly way to reduce the alarm caused by blasting to nearby residents. It can also be used to quickly alert crews in emergencies, anytime day or night.

TSUNADO Alert Radios are discrete and elegant, and are a welcome addition to every home. They can be configured to deliver soft and gentle music in advance of blasting for the general public, or wakeup tones when directed to staff in emergencies.
